

ABSTRACT

A method and apparatus for saving and storing data in a data record of an application into a memory storage in a portable device in a wireless system. The method comprises  
5 the steps of detecting a mode change from a second mode to a first mode during edit view, saving and storing data from the edit view as a response to said mode change from a second mode to a first mode during edit view. According to an aspect of the invention said mode change can be executed by changing  
10 a flip coverage of the device from open to closed.
